

These days, green technology seems to be on the mind of every business manager. This is doubly true in industries that use forklifts – where not-so-earth-friendly lead-acid batteries, LP gas or diesel have dominated working environments for years. In fact, to go “green” without eating into productivity may seem pretty hard to do. But what if there was a solution that actually *increased* productivity? And what if there was a company that could not only take care of converting your trucks to “green machines” but also provide all of the after-conversion support your company needs?

The leaders in lift truck technology plus local aftermarket services – Hyster and Barloworld Handling – can outfit your fleet with the latest green power source to hit the market. **Hydrogen Fuel Cells** can:

- * Eliminate hours spent recharging or changing batteries. Refueling a hydrogen cell power pack can take as little as 3 to 5 minutes.
- * Maintain a constant voltage for steady speed throughout the day.
- * Automate the refueling procedure. No utility hookups required.
- * Eliminate harmful emissions.

The Tools to Refuel

Barloworld Handling and our associated vendors can assist you in finding a source of hydrogen for refueling your cells that best suits your facility and operations:

- Hydrogen delivery offers a no-fuss, easy supply of hydrogen without any permanent installations.
- An on-site hydrogen generator can ensure an uninterrupted supply of hydrogen around the clock.
- An entire on-site hydrogen fueling system is a cost-effective solution that is fast and completely automatic.

And if you are still not sure which source you like, a temporary mobile fueler gives you the opportunity to test out hydrogen cell technology before finding a long-term solution.

to Get Started

It only takes one call to your local Barloworld Handling dealer to get started on the path to better productivity and greener operations:
